

7-Zip Mass Compressor

Documentation

This documentation outlines the functionality and usage of the Batch-based mass compression tool designed for high-efficiency data archival.

Key Features

- ✓ Recursive processing of nested subdirectories.
- ✓ Direct implementation of 7-Zip's Ultra (L9) LZMA2 algorithm.
- ✓ Dynamic runtime memory allocation (Dictionary Size).
- ✓ Intelligent file-handling to prevent recursive archive loops.
- ✓ Post-process data validation and optional cleanup.

Installation & Setup

1. Ensure 7-Zip is installed at `C:\Program Files\7-Zip\7z.exe`.
2. Copy the script to the target root directory.
3. Execution does not require elevated privileges unless target directories have restricted ACLs.

RAM Requirements: Compression at Ultra levels is memory-intensive. For a 128MB dictionary, ensure at least 2GB of system memory is available to avoid process termination.

Technical Details

The script utilizes the `%~dpnf` expansion variable to resolve absolute paths during iteration, ensuring that even with complex ROM naming

conventions (containing parentheses or special characters), the output integrity is maintained.
